IA#3 — API contract: the agent implements it, the tests judge · rubric

CSC13114 · individual assignment · 2% of the course · 100 points

Session 5, started in the room and finished at home. Start from the starter repository linked in this assignment (`github.com/fithcmus/awad-api-contract-starter`). Its `README.md` gives the steps; `CONTRACT.md` is the specification your agent implements.

Use your assistant. Nothing in this assignment asks you to type code yourself: it scores what the API does, what you predicted and checked before you trusted the agent, and how you handled the sentences of the contract that could be read two ways.

Due Wednesday, October 28, 2026, 22:00. Done alone — this is not team work.

What you hand in

One zip of your repository, **including `.git`**, so that the order of your commits can be read. It must contain:

File	What it is
`src/v1.js`, `src/app.js`, `migrations/002_*`	the `/v1` implementation your agent wrote, with your fixes
`contract-run-1.txt`	`npm run contract 2>&1 | tee contract-run-1.txt` — the agent's **first** attempt, before any fix
`contract-run-final.txt`	the same command after your last fix
`NOTES.md`	your predictions, the failures and the ambiguous sentences (criteria 3–5)
`AI-LOG.md`	as for every assignment
`SELF_ASSESSMENT_REPORT.md`	see *How to submit*

Leave out `node_modules/` (there is none) and `data/`.

What is scored

#	Criterion	Points
1	The contract tests pass	30
2	The rules were kept	10
3	Predictions, made before the agent ran	10
4	The first run, read line by line	20
5	The sentences that could be read two ways	20

#	Criterion	Points
6	`AI-LOG.md`	10

1. The contract tests pass — 30 points

We unzip your repository and run `npm run migrate && npm run seed && npm test && npm run contract` on Node 22.5 or later. The score comes from **our** run; `contract-run-final.txt` must match it.

Points	What it looks like
30	Legacy 3 of 3 and contract **29 of 29**, and `contract-run-final.txt` shows the same.
20–29	Legacy 3 of 3, contract 25–28 of 29. One point fewer for each failing test below 29.
10–19	Legacy 3 of 3, contract 15–24 of 29.
0–9	Fewer than 15 contract tests pass, the legacy tests fail, or the service does not start.

If our run and `contract-run-final.txt` disagree, we score our run and say so in the feedback.

2. The rules were kept — 10 points

Checked with `git diff` against the starter commit.

Points	What it looks like
10	Nothing under `test/` and nothing in `CONTRACT.md` changed. Every new table is in a new `migrations/002_*.up.sql` with a matching `.down.sql`.
5–9	One of: a new table created outside a migration, or a migration with no `down`.
0	`test/` or `CONTRACT.md` was changed — and **criterion 1 is then scored 0 as well**, since a test that was edited to pass no longer judges anything. If you think a test or the contract is wrong, write it in `NOTES.md`: that is a finding, not a failure.

3. Predictions, made before the agent ran — 10 points

Points	What it looks like
9–10	`NOTES.md` names **two sentences of `CONTRACT.md`**, quoted or with their section number, that you expected the agent to get wrong, each with a reason. The commit that adds them comes **before** the first commit that changes `src/`. At the end, one line per prediction says whether it came true.
5–8	Two predictions, but one has no reason, or the outcome is not recorded.

Points	What it looks like
1–4	Predictions written after the first run (the commit order shows it), or only one.
0	None.

4. The first run, read line by line — 20 points

Points	What it looks like
17–20	`contract-run-1.txt` is committed **before** any commit that fixes `src/` after the agent's first attempt. `NOTES.md` has **one line per test that failed** in it: the sentence of the contract, what the agent did instead, and — when the sentence could be read two ways — the wording you would change it to.
11–16	Every failure has a line, but some only repeat the test name without saying what the agent did.
4–10	Only some failures are explained, or `contract-run-1.txt` was clearly re-run after fixes (fewer failures than the commits show).
0–3	No `contract-run-1.txt`, or no explanation of it.

If the agent's first attempt passed all 29 tests, say so: this criterion is then scored on criterion 5's list instead — pick the **three** points the agent said it guessed at and explain each one the same way.

5. The sentences that could be read two ways — 20 points

You asked the agent: *"Which sentences of `CONTRACT.md` could be read two ways, and what did you choose for each?"* A green run does not mean the contract is complete — only that the tests found nothing.

Points	What it looks like
17–20	The agent's answer is in `NOTES.md` (pasted or summarised). For **each** point: the section, the two readings, the one you chose and why, and the sentence you would add to `CONTRACT.md`. At least one point is one the agent **did not** list — found by you.
11–16	Every point from the agent has a decision and a proposed sentence; none found by you.
4–10	The agent's list is pasted with no decision, or decisions with no proposed wording.
0–3	Missing, or "no ambiguities" accepted without checking.

6. `AI-LOG.md` — 10 points

Points	What it looks like
9–10	The prompt you handed over and every fix prompt are logged. Fix prompts name the **test and the contract section**, not test code. *Changed* and *Rejected* are real: at least one thing the agent wrote that you did not keep, and why.
5–8	Prompts logged, but a fix prompt pastes test code, or *Rejected* is empty.
1–4	A summary with no prompts.
0	No `AI-LOG.md`.

How to submit

One zip file, named after your student ID **and the total you give yourself**: `<StudentID>_<total>.zip`, for example `23120001_82.zip`. Turn it in from your `<StudentID>@student.hcmus.edu.vn` Google account.

The zip must contain **`SELF_ASSESSMENT_REPORT.md`**: one row per criterion in this rubric, the marks you claim, and evidence pointing at a file, a commit, a test name or a section of `NOTES.md` — plus a short *what I did not manage*. The total in that table is the number in the file name. Template on Classroom.

A wrong file name costs no marks but delays your result — the grading script matches submissions to the class list by that name.

Honesty adjustment

Your self-assessment is compared with the mark you actually earn. The gap is `your total − the mark`, on the same 100-point scale.

Gap	Adjustment
within ±10	none — this is normal calibration
+11 to +20	−3
+21 to +30	−6
more than +30	−10
−21 or worse	−3 — read the rubric before you score yourself down
no `SELF_ASSESSMENT_REPORT.md`	−10, and the file-name total is ignored

A criterion you claim with no evidence line counts as claimed-and-not-done for this comparison. The adjustment never takes a submission below 0.
